LIST OF APPENDICES

1.0 EXECUTIVE SUMMARY

This report has been prepared by Occidental Chemical Corporation (OxyChem) to describe the Phase II activities performed in support of the characterization of the Love Canal Bagged Wastes currently stored at OxyChem's Niagara Plant in Niagara Falls, New York. The Phase II sampling and analysis program was described in the "Phase I Report, Love Canal Bagged Wastes, Occidental Chemical Corporation", February 26, 1998.

OxyChem has completed Phase II of the SAP. In accordance with the SAP, the report describes the characterization of the bagged materials for disposal. A total of 11,151 bags were represented in the Phase II sampling program. Four categories (Creek Sediment 1, Creek Sediment 2, Haul Roads, and Facility Cleanup) were characterized.

The Phase II results showed that no category qualified in its entirety for direct landfill disposal.

The Creek Sediment 1 category had three groups of bags which met the current land disposal restrictions (LDRs), 12 groups of bags which exceeded the current LDRs but which would be landfilled with the petitioned for Dioxin variance limit of 10 ppb, and one group of bags which exceeded the petitioned for Dioxin variance limit and will be incinerated. The Dioxin variance refers to the OxyChem petition for a variance limit of 10 ppb for total tetra- through hexa-dioxins and furans regulated under F039 LDRs, as detailed in Section 4.0 of this report.

The Creek Sediment 2 category had three groups of bags which met the current LDRs and one group of bags which exceeded the current LDRs but would be landfilled under the Dioxin variance.

The Haul Roads category had three groups of bags which met the current LDRs and 11 groups which would be landfilled under the Dioxin variance.

The Facility Cleanup category had an exceedance for BHCs which requires the incineration of 10 groups of bags. Of the remaining groups in this category, one group met the current LDRs and nine groups exceeded the current LDRs but would be landfilled under the Dioxin variance.

All sampling was performed as outlined in the Phase I report. Additional sampling was performed for the Creek Sediment 1 category for the bag series 724 to 1,447 to further characterize the dioxins/furans content. This sampling was described in letters sent to

USEPA on March 25 and May 22, 1998. Six additional samples were collected to better represent the bag series.

The Phase II sampling program has been used by OxyChem to determine which groups of bags can be directly landfilled, which groups can be landfilled with the Dioxin variance, and which groups of bags require incineration. The results are in agreement with the projections made based on the Phase I data.

Sampling in Phase I and Phase II has shown that 3,672 bags can be landfilled under the current LDRs, and an additional 6,745 bags can be landfilled under a Dioxin variance to the LDRs. A total of 691 bags do not qualify for landfill disposal with or without the variance, and will be incinerated prior to disposal.

Previously, it was agreed that 751 Sewer Sediment bags and 60 Carbon bags would be incinerated prior to disposal. Phase I sampling showed that 3,811 Creek Debris bags did not qualify for direct disposal even with the Dioxin variance. Phase II sampling showed that an additional 691 bags did not qualify for direct disposal even with the Dioxin variance. Thus, by prior agreement and as the result of Phase I and Phase II sampling, a total of 5,313 bags have been or will be incinerated prior to disposal.

2.0 INTRODUCTION

This report has been prepared by Occidental Chemical Corporation (OxyChem) to describe the Phase II activities performed in support of the characterization of the Love Canal Bagged Wastes currently stored at OxyChem's Niagara Plant in Niagara Falls, New York. The Phase II sampling and analysis program was originally described in the "Phase I Report, Love Canal Bagged Wastes, Occidental Chemical Corporation", February 26, 1998.

The original Love Canal Partial Consent Decree provided that OxyChem would dispose of the Love Canal remediation wastes by incineration at a thermal destruction unit to be constructed at the Niagara Plant or at alternative thermal destruction facilities approved in advance by the USEPA and NYSDEC. The waste was subsequently reclassified as F039 waste and the decree was modified in 1997 to allow landfilling of certain remediation wastes where chemical levels in the wastes were shown to be less than the LDRs for F039 waste materials, using the SW-846 statistical test to determine the appropriate parameters and number of samples for testing.

The Phase I and II sampling programs were set forth in the USEPA/NYSDEC approved "Sampling and Analysis Plan (SAP), Love Canal Wastes", dated June 3, 1996. Phase I of the SAP was performed from September to November 1996 and consisted of an initial comprehensive characterization of approximately one percent of the bagged materials. A summary of the bagged waste identification is presented in Table 2.0. The bags were separated into five categories (Creek Sediment 1, Creek Sediment 2, Haul Roads, Creek Debris, and Facility Cleanup). Each bag chosen for sampling was analyzed for complete F039 LDR list testing.

The Phase I characterization was designed to provide the data needed to determine what additional statistically based sampling and analysis (Phase II) was needed to determine treatment and disposal in accordance with the LDRs. The Phase I data were used to define the number of samples to be collected in Phase II and the parameters to be analyzed for Phase II sampling and analysis.

Based on the Phase I results and previous agreements, bags for the Sewer Sediment, Carbon, and Debris categories are being incinerated. At the current rate of disposal, shipments of these materials to incineration facilities will be completed in September 1998. The Creek Sediment 1, Creek Sediment 2, Haul Roads, and Facility Cleanup categories were included in the Phase II program. The Phase II sampling program has provided the results which have been used to determine which groups of

bags can be directly landfilled, which groups would be landfilled with a Dioxin variance, and which groups of bags require incineration.

3.0 SAMPLING AND ANALYTICAL PROGRAM

Sixty-one samples (including seven field duplicates) were collected and submitted for analysis for the Phase II program. All sampling was performed in accordance with Phase II Sampling, Section 6.0 of the Phase I Report, which was approved by USEPA verbally on January 29, 1998 and formally on May 7, 1998. The Phase I report was based on the approved SAP of June 3, 1996. Sample collection began on February 4, 1998, and concluded on April 1, 1998.

3.1 GROUP SELECTION PROCEDURE

The number of samples required for each category in the Phase II sampling was obtained from the Phase I analytical results. Pages five (5) and six (6) of the SAP present the criteria used for determining the number of samples and analyses required for each category. A summary of the sampling requirements is presented in Table 3.1.

For the Creek Sediment 1 category, ten samples were required for the Phase II sampling. Table 2.0 specifies that there are 7,232 Creek Sediment 1 bags. The category was divided into ten groups of approximately 723 bags. A sample from each group was analyzed for dioxins/furans and phenanthrene/fluoranthene. One group was also selected for TCLP lead analysis. Based on the Phase I and Phase II sample results, it was evident that the total dioxins/furans concentration was significantly higher in the 801 to 1,000 bag series. These bags are within the 724 to 1,447 bag group. To better represent the bag group, additional Phase II sampling was performed. The bags surrounding the 801 to 1,000 bag series were sampled by collecting one sample from each sub-grouping as follows:

Sub-Group	*Number of Samples In Composite*
724-800	3
1,001-1,100	4
1,101-1,200	4
1,201-1,300	4
1,301-1,400	4
1,401-1,447	2

Less than four grab samples were collected for sub-groups of less than 100 bags because it was difficult to find more than one bag for every 25 bags in a group without physically moving the bags.

The results of the additional Phase II sampling have been used to characterize the sub-groups for disposal. The bags in the 801 to 1,000 bag series will be incinerated, as the Phase I and Phase II results exceeded the proposed variance limit for dioxins/furans.

The Creek Sediment 2 category required four Phase II samples. Table 2.0 specifies that there are 1,512 bags in this category. The category was divided into four groups of 378 bags. A sample from each group was analyzed for dioxins/furans.

The Haul Roads category Phase II sampling required 14 samples. Table 2.0 specifies that there are 1,450 bags in this category. The category was divided into 14 groups of approximately 103 bags. A sample from each group was analyzed for dioxins/furans. One group was also selected for aldrin analysis.

The Facility Cleanup category required 21 Phase II samples. Table 2.0 specifies that there are approximately 957 bags in this category. The category was divided in 21 groups of approximately 41 bags. A sample from each group was analyzed for dioxins/furans. Two groups (one from each half of the category) were also selected for BHCs analyses. No sample was collected from the Facility Cleanup 14,990 to 15,032 bag series. This bag series could not be located during sample collection. If the bags are located during shipping activities, either additional Phase II sampling and analysis will be performed, or the bags will be incinerated.

3.2 SAMPLE COLLECTION

A sample collection and analysis summary with the bag groups represented is provided in Appendix A. No bags sampled in Phase I were used in Phase II.

3.3 SAMPLING PROCEDURE

Each Phase II sample consisted of grab samples from four individual bags (except where previously noted) chosen at random within each group in a category. The individual grab samples were laboratory composited into one sample, and the composite sample was analyzed. Laboratory compositing was used in the Phase II sampling because VOCs were no longer part of the analytical program and because this procedure was the same as used by the receiving disposal company's Waste Analysis Plan (WAP) for landfill disposal.

The selected bags were on the edge or surface of the pile. A sample was obtained by opening the bag, inserting a clean polystyrene scoop at least six inches below the surface of the material, and collecting a grab sample. The samples were placed directly into clean sample jars and sealed with teflon caps, and the bags were resealed.

A sample log was used to record pertinent information as samples were collected. The log included the sample date and the bag numbers for each composite.

3.4 CHAIN OF CUSTODY FORMS

Chain of custody forms were used to track all samples from the time of sampling to the arrival of samples at the laboratories.

Copies of the executed chain of custody forms are located in the quality assurance/quality control (QA/QC) review of the data (see Appendix C).

3.5 SAMPLE CONTAINERS AND HANDLING

All samples were placed in appropriate sample containers, labeled, and properly sealed. The sample labels included bag sample number, place of collection, date and time of collection, and analyses to be performed. Samples were cushioned within the shipping coolers by the use of bubble pack. Samples were kept cool by the use of plastic bags of ice or cooler packs, as required. Samples were shipped priority overnight by commercial courier on a daily basis to the project laboratories.

3.6 LABORATORY COMPOSITING

Each of the individual grab samples collected within a given group were homogenized and composited at the laboratory. Compositing was accomplished by mixing equal volumes of each of the grab samples.

The composite sample was homogenized by removing any large rocks present in the sample. The sample was thoroughly mixed in the stainless steel pan using a stainless steel spoon. The sample was scraped from the sides, corners, and bottom of the pan, rolled to the middle of the pan, and initially mixed. The sample was quartered and moved to the four corners of the pan. Each quarter of the sample was mixed

individually, and then rolled to the center of the pan and the entire sample mixed again. The mixed sample was placed directly into a clean sample jar and sealed with a teflon-lined cap. Any remaining sample was archived for possible future use.

3.7 ANALYTICAL PROGRAM

Samples were analyzed for the F039 LDR list of parameters obtained from the Phase I data. Site specific matrix spike/matrix spike duplicate (MS/MSD) analyses were performed at a minimum frequency of one in twenty samples. All analyses were performed in accordance with the June 1996 SAP and the Phase I Report.

An analytical results summary with the associated LDRs is provided in Appendix B. All laboratory results were validated and any required sample qualifications have been included in the table. A full discussion of the QA/QC Review can be found in the validation report, located in Appendix C of this report.

All data were judged to be acceptable for their intended use.

4.0 REGULATORY VARIANCE

OxyChem has petitioned for a Dioxin (dioxins/furans) LDR treatability variance, pursuant to 40 CFR 268.44 for the Creek Sediment 1, Creek Sediment 2, Haul Roads, and Facility Cleanup categories. The petition was originally submitted to USEPA on November 4, 1997, revised, and re-submitted on June 4, 1998. The proposed variance would establish alternative treatment standards for dioxins/furans of 10 ppb (see Table 4.0). Materials meeting the alternative standard can be disposed of in a RCRA Subtitle C permitted landfill.

5.0 DISCUSSION OF RESULTS

A review of the analytical results in Appendix B showed that no samples exceeded the LDR limits for phenanthrene, fluoranthene, TCLP lead, or aldrin. One group of Facility Cleanup bags (15,291 to 15,774) exceeded the LDR limits for BHCs. These bags will be incinerated.

All remaining LDR exceedances were dioxins/furans. A summary of the LDR evaluations for the Phase II results for each category follows. Field duplicate results are not included in this discussion.

5.1 CREEK SEDIMENT 1 (7,232 BAGS - 10 BAG GROUPS)

A summary of the LDR exceedances is presented in Table 5.1. There were no LDR exceedances for phenanthrene, fluoranthene, or TCLP lead. Three bag series had no LDR exceedances. One bag series had dioxins/furans results which exceeded ten parts per billion (ppb) and will be incinerated. The results for the sub-groups collected as additional Phase II samples (described in Section 3.1) all exceeded the current 1 ppb LDR but were less than or equal to the proposed Dioxin variance limit of 10 ppb. The remaining bag series had dioxins/furans results which exceeded the current 1 ppb LDR but were less than or equal to the proposed Dioxin variance limit of 10 ppb.

5.2 CREEK SEDIMENT 2 (1,512 BAGS - FOUR BAG GROUPS)

A summary of the LDR exceedances is presented in Table 5.2. Three bag series had no LDR exceedances. The remaining bag series had dioxins/furans results which exceeded the current 1 ppb LDR but were less than the proposed Dioxin variance limit of 10 ppb.

5.3 HAUL ROADS (1,450 BAGS - 14 BAG GROUPS)

A summary of the LDR exceedances is presented in Table 5.3. There were no LDR exceedances for aldrin. Three bag series had no LDR exceedances. The remaining bag series had dioxins/furans results which exceeded the current LDR of 1 ppb but were less than the proposed Dioxin variance limit of 10 ppb.

5.4 FACILITY CLEANUP (957 BAGS - 21 BAG GROUPS)

A summary of the LDR exceedances is presented in Table 5.4. No sample was obtained for bag groups 14,990 to 15,032. There was an LDR exceedance for BHCs, and the bags in the associated groups will be incinerated. Three bag series had no dioxins/furans LDR exceedances. The remaining bag series had dioxins/furans results which exceeded the current LDR of 1 ppb but were less than the proposed Dioxin variance limit of 10 ppb.

6.0 FINAL BAG DISPOSITION - PHASE I AND PHASE II SAMPLING

The disposition of each bag for each of the four categories is presented in Tables 6.1 (Creek Sediment 1), 6.2 (Creek Sediment 2), 6.3 (Haul Roads), and 6.4 (Facility Cleanup). The disposition is based on both Phase I and Phase II sample results.

The disposal of the bags sampled in Phase I was based solely on the individual bag's Phase I sample results previously presented in Section 5.0 of the Phase I Report. All remaining bags will be disposed of based on the Phase II sample results presented in Appendix B and summarized in Section 5.0 of this report.

If a Phase I bag's disposal characterization agreed with its Phase II bag grouping, it was included in the grouping. If a Phase I bag's disposal characterization differed from its Phase II bag grouping, it is listed on the tables individually.

Bags designated for landfill had no results detected above the current LDRs for samples collected in Phase I or Phase II. Bags designated for landfill with the variance had dioxins/furans results greater than the current LDR of 1 ppb but equal to or less than the proposed Dioxin variance limit of 10 ppb, and had no results detected above the LDR for any other regulated F039 parameter for samples collected in Phase I or Phase II. Bags designated for incineration had results detected above the Dioxin variance limit of 10 ppb for dioxins/furans or had an LDR exceedance for any other regulated F039 parameter for samples collected in Phase I or Phase II. Bags requiring stabilization exceeded the LDR for TCLP lead in Phase I sampling.

7.0 CONCLUSION

OxyChem has completed Phase I and Phase II sampling as required by the SAP for the Love Canal Bagged Wastes. In accordance with the SAP, the Phase I data were used to develop the sampling frequency and analyte list for Phase II of the program. The Phase II data were used to characterize the waste material for disposal, and are the definitive data used to determine the final disposal method as stated and agreed to in the approved SAP of June 3, 1996 and the approved Phase I report of February 26, 1998.

A summary of the disposal quantities is presented in Table 7.0. Each waste category will be disposed as follows.

7.1 CREEK SEDIMENT 1 (7,232 BAGS)

Based on the Phase I and Phase II data, 2,177 bags will be landfilled. One of these bags requires stabilization for metals prior to landfill disposal. An additional 4,854 bags will qualify for landfill disposal with the Dioxin variance. One of these bags requires stabilization for metals prior to landfill disposal. These 4,854 bags will be stored until the ruling on OxyChem's petition for a variance from the 1 ppb dioxin LDR standard is final. A total of 201 bags will be incinerated in accordance with the analytical results from the sampling and analysis programs.

7.2 CREEK SEDIMENT 2 (1,512 BAGS)

Based on the Phase I and Phase II data, 1,132 bags will be landfilled. An additional 379 bags will qualify for landfill disposal with the Dioxin variance. These bags will be stored until the ruling on OxyChem's petition for a variance from the 1 ppb dioxin LDR standard is final. One bag will be incinerated in accordance with the analytical results from the sampling and analysis programs.

7.3 HAUL ROADS (1,450 BAGS)

Based on the Phase I and Phase II data, 318 bags will be landfilled. An additional 1,128 bags will qualify for landfill disposal with the Dioxin variance. These bags will be stored until the ruling on OxyChem's petition for a variance from the 1 ppb dioxin LDR standard is final. Four bags will be incinerated in accordance with the analytical results from the sampling and analysis programs.

7.4 FACILITY CLEANUP (957 BAGS)

Based on the Phase I and Phase II data, 45 bags will be landfilled. An additional 384 bags will qualify for direct landfill disposal with the Dioxin variance. These bags will be stored until the ruling on OxyChem's petition for a variance from the 1 ppb dioxin LDR standard is final A total of 485 bags will be incinerated in accordance with the analytical results from the sampling and analysis programs. One group of 43 bags has not yet been characterized in Phase II because it was not found. If it is found during the bag loading for disposal, it will be characterized prior to disposal or incinerated.

LOVE CANAL BAGGED WASTES
PHASE II REPORT
OCCIDENTAL CHEMICAL CORPORATION
NIAGARA FALLS, NEW YORK

	Total Number of Bags for		
	Landfill Now	*Landfill When Variance is Approved*	*Incineration*
Creek Sediment 1 (7,232 Bags)	2,177 (2)	4,854 (2)	201
Creek Sediment 2 (1,512 Bags)	1,132	379	1
Haul Roads (1,450 Bags)	318	1,128	4
Facility Cleanup (957 Bags) (3)	45	384	485
TOTAL	3,672	6,745	691

otes:

) Categories included in the Phase II sampling program. Bags from the Sewer Sediment, Creek Debris, and Carbon waste categories have been previously designated for incineration prior to landfill disposal.

) Includes one bag that requires stabilization for lead prior to disposal.

) One group of 43 bags could not be located during Phase II sampling.

QUALITY ASSURANCE/QUALITY CONTROL (QA/QC) REVIEW

QUALITY ASSURANCE/QUALITY CONTROL (QA/QC) REVIEW
OCCIDENTAL CHEMICAL CORPORATION
LOVE CANAL BAGGED WASTES
PHASE II SAMPLING PROGRAM
NIAGARA FALLS, NEW YORK
FEBRUARY -APRIL 1998

TABLE OF CONTENTS

LIST OF TABLES
(Following Report)

LIST OF ATTACHMENTS

1.0 EXECUTIVE SUMMARY

Solid samples of Love Canal waste material were collected from bags stored in buildings located at the Occidental Chemical Corporation (OxyChem) Niagara Plant in Niagara Falls, New York from February through April 1998. All sampling and analyses were performed in accordance with Section 6.0 of the "Phase I Report - Love Canal Bagged Wastes, Occidental Chemical Corporation, February 1998" and the June 1996 Sampling and Analysis Plan (SAP), both approved by the United States Environmental Protection Agency (USEPA). All samples were submitted for Phase II F039 Land Disposal Restriction (LDR) list analyses, which included polychlorinated dibenzo-p-dioxins and polychlorinated dibenzofurans (PCDDs/PCDFs), toxicity characteristic leaching procedure (TCLP) lead, phenanthrene, fluoranthene, BHCs, and aldrin.

CONCLUSION

Based on the assessment and validation of the analytical data provided, these data have been judged acceptable for their intended use with the qualifications noted.

2.0 INTRODUCTION

Sixty-one samples (including seven field duplicates) were submitted for analysis in support of Phase II Sampling Program for the Love Canal bagged waste materials. Each sample consisted of two to four individual grab samples which were collected in the field and sent to the analytical laboratories for compositing. The bagged materials are stored at OxyChem's Niagara Plant in Niagara Falls, New York. Sample collection was performed from February 1998 to April 1998. The samples were analyzed by Encotec Laboratory (Encotec) in Ann Arbor, Michigan and Alta Analytical Laboratory, Inc. in El Dorado Hills, California. Samples were submitted for the Phase II F039 LDR analyses of PCDDs/PCDFs, TCLP lead, fluoranthene, phenanthrene, BHCs, and aldrin.

Copies of the chain of custody forms are included in Attachment A.

Summaries of the sampling and analysis program and the analytical results are provided in the Phase II report.

Samples were analyzed in accordance with the methods referenced in Table 1. All laboratory reports included summary reports and the accompanying raw data. The Quality Assurance/Quality Control (QA/QC) criteria by which these data have been assessed are outlined in the analytical methods. Additional validation guidance was referenced from the following documents:

i) "USEPA Contract Laboratory Program National Functional Guidelines for Organic Data Review" EPA 5400/R-94/012, February 1994;

ii) "USEPA Contact Laboratory Program National Functional Guidelines for Inorganic Data Review", EPA-5400/R-94-013, February 1994;

iii) "CLP Organics Data Review and Preliminary Review", SOP No. HW-6, Revision #11, May 1996;

iv) "Evaluation of Metals Data for the Contract Laboratory Program (CLP)", SOP Revision XI, January 1992;

v) "USEPA Region II Data Validation SOP for SW-846 Method 8290, PCDDs and PCDFs by HRGC/HRMS", SOP No. HW-19, Revision 1, October 1994; and

vi) "TCLP Data Validation", SOP No. HW-7, Revision #3, March 1993.

3.0 QA/QC REVIEW

HOLDING TIMES

The holding time criteria specified in the analytical methods are noted in Table 1. Table 2 presents a summary of all collection, extraction, and analysis dates. All samples were extracted and analyzed within the recommended holding times.

All samples were chilled, transported, and stored by the laboratory at 4°C (±2°C).

INSTRUMENT CALIBRATION

PCDDs/PCDFs

High resolution gas chromatography/high resolution mass spectrometry (HRGC/HRMS) instrumentation was properly tuned prior to sample analysis. Overall, calibration data showed adequate instrument sensitivity and calibration curves showed acceptable linearity. All ion abundance ratios were within the method-specified control limits.

All native and labeled analyte concentrations were acceptable for the calibration verification standards. All ion abundance ratios were within the method-specified control limits for each PCDD/PCDF.

Gas Chromatograph/Mass Spectrometer (GC/MS) - Phenanthrene, Fluoranthene

The GC/MS instrumentation was properly tuned prior to sample analyses. Calibration data showed adequate instrument sensitivity, and calibration curves showed acceptable linearity.

Gas Chromatograph (GC) - Aldrin, BHCs

All GC instrument evaluation standards demonstrated acceptable performance. All initial calibration data for the GC analyses showed adequate instrument sensitivity and linearity.

Most continuing calibration standard results were acceptable.

The continuing calibration standard results for the March 14, 1998 analysis indicated slight variability in instrument response for the pesticide analyses, and all associated positive results were qualified as estimated. Associated non-detect results were judged to be acceptable based on adequate instrument response for the standards.

TCLP Lead - Inductively Coupled Plasma-Atomic Emission Spectrometer (ICP)

Calibration curves and initial calibration verification (ICV) and continuing calibration verification (CCV) standards were analyzed at the proper frequency.

The calibration curves were acceptable and all ICV and CCV recoveries were within the required control limits.

Interference check standards were analyzed at the proper frequency and all recoveries were acceptable.

INTERNAL STANDARD RECOVERIES - PHENANTHRENE, FLUORANTHENE

The proper internal standard (IS) compound was added to all samples, blanks, standards, and spike samples prior to analysis. A summary of the recoveries is presented in Table 3. All IS recoveries and retention times were acceptable.

INTERNAL STANDARD RECOVERIES - PCDDs/PCDFs

A summary of the internal standard recoveries is presented in Table 4.

The proper internal standard compounds were added to all samples, matrix spike samples, and blanks prior to extraction. Internal standards were used to quantify the 2,3,7,8-substituted PCDDs/PCDFs present in the samples (isotope-dilution mass spectrometry) as well as to determine the overall method efficiency. All internal standard recoveries for the analytes of interest were acceptable except for sample HR Comp 19, which had several low recoveries. All sample results were qualified as estimated based on the low recoveries.

CLEANUP STANDARD RECOVERIES - PCDDs/PCDFs

A summary of the cleanup standard recoveries is presented in Table 4.

The proper cleanup standard compound was added to all samples and blanks subsequent to extraction, but prior to fractionation. All recoveries showed acceptable analytical efficiency.

RECOVERY STANDARDS - PCDDs/PCDFs

Recovery standards were added to each sample prior to analysis.

The recovery standard area counts were assessed with respect to the associated continuing calibration standard. Most area counts were acceptable. Some high area counts were reported for samples CS1 Comp 1, CS1 Comp 2, CS1 Comp 2A, CS1 Comp 3, CS1 Comp 8, CS1 Comp 9, CS1 Comp 51, CS1 Comp 52, and CS1 Comp 55. All affected sample results were qualified as estimated.

SURROGATE COMPOUND ANALYSES - ORGANICS

Surrogate were added to all samples, blanks, and QC samples prior to extraction and/or analysis.

A summary of surrogate recoveries is presented in Table 5. All surrogate were acceptable except for one high pesticide surrogate recovery for sample F Comp 12. Associated positive sample results were qualified as estimated. Non-detect results were not impacted by the indicated high bias.

METHOD BLANK ANALYSES

Method blanks were analyzed and/or extracted at the proper frequency for all parameters, and the results are summarized in Table 6. All method blank results were non-detect.

MATRIX SPIKE/MATRIX SPIKE DUPLICATE (MS/MSD) ANALYSES

Matrix spikes were prepared and/or analyzed in duplicate with each batch of samples. The MS/MSD analysis for phenanthrene and fluoranthene consisted of representative semi-volatile organic compounds (SVOCs). A summary of the spike results is presented in Table 7.

The TCLP lead and SVOC spike recoveries demonstrated acceptable analytical accuracy and precision. No aldrin spike recoveries were available for sample HR Comp 38 due to laboratory dilution. Accuracy for this analysis was based on the blank spike recoveries.

The pesticide MS/MSD analysis for sample F Comp 12 resulted in high recoveries for all parameters of interest. All associated positive results were qualified as estimated. Associated non-detect results were not impacted by the indicated high bias.

DUPLICATE ANALYSIS - TCLP LEAD

One sample submitted for TCLP lead analysis was digested and analyzed in duplicate. A summary of the results is presented in Table 8. The duplicate results demonstrated acceptable agreement.

BLANK SPIKE/BLANK SPIKE DUPLICATE (BS/BSD) ANALYSES

BS samples were prepared in duplicate and analyzed with each batch of samples. The results are summarized in Table 9. All BS/BSD analyses were acceptable except for slightly low recoveries for phenanthrene. All associated sample results were non-detect and were judged acceptable based on sufficient analyte recovery.

ANALYTE IDENTIFICATION AND QUANTITATION

Analyte identification and quantitation were performed according to the methods.

In addition, total PCDD and total PCDF concentrations represent the sum of all analytes which meet the identification criteria and may include non-2,3,7,8-substituted PCDD/PCDF analytes for which the instrument was not calibrated. Total PCDD/PCDF concentrations in these cases are identified in the analytical results summary by the total

PCDD/PCDF concentration being greater than the total concentration for the corresponding 2,3,7,8-substituted analyte(s), and should be considered estimated.

Diphenyl ether interferences were observed in the PCDF analyses for some samples. Based on a potential high bias, the associated sample results were qualified as estimated.

FIELD QA/QC

Field Duplicate Analyses

Seven samples were collected in duplicate and submitted to the laboratory for analysis. A comparison of the field duplicate results is presented in Table 10. The results showed acceptable analytical and sampling precision.

4.0 CONCLUSION

Based on the assessment and validation of the analytical data provided, these data have been judged acceptable for their intended use with the qualifications noted.
